Working principle

The measurement principle is based on Faraday's induction law. A voltage V is induced between a pair of electrodes when a conductive liquid flows in a pipe of diameter D at an average velocity v , through a magnetic field B (which is perpendicular to the flow direction).

This voltage, proportional to the average velocity of the liquid, is acquired by the electronic converter in order to be processed and converted to a flow rate measurement.

$$V = B \cdot v \cdot D$$

V = Voltage across the electrodes

v = Liquid velocity

B = Magnetic field strength

D = Pipe diameter

Applications

- Water supply & water treatment plants
- Food and beverage industries
- Leak detection in pipelines & chemicals flow monitoring
- HVAC

Installation

- Sensor must not be installed in the upper or lower parts of the pipe, in order to avoid air bubbles or solids sedimentation.

- Pipe must always be full of liquid.
- Required straight pipe run depends on the flow profile, which can be affected by the disturbing elements found in the installation before and after the sensor, as shown in the following chart:

Disturbing element before the sensor	Minimum distance between the element and the sensor
90° elbow or T-bend	50 x DN
Several 90° coplanar bends	50 x DN
Several 90° non-coplanar bends	80 x DN
Total angle convergent 18° to 36°	30 x DN
Total angle divergent 14° to 28°	55 x DN
Fully opened butterfly valve	45 x DN
Fully opened plug valve	30 x DN

After the sensor a minimum straight pipe run of 5 x DN is required.

Insert pipe adaptor

There are two different types of insert pipe adaptors. For pipe size DN40 ... DN65, insert pipe adaptor is supplied already welded to short length of pipe that must be just coupled to the pipe by welding or gluing (in the case of PVC).

For pipe size of DN80 or bigger, insert pipe adaptor is directly welded (or glued) on the pipe.

Flow ranges

Sensor selection

The diagram shows the correspondance between the liquid velocity and the flow rate for different sensor sizes.

The sensor size should be chosen selecting a liquid velocity of about 3-4 m/s. The minimum liquid velocity should not be below 0.5 m/s.

When the liquid has solids in suspension, it is better to work between 3 and 5 m/s in order to avoid sedimentation in the pipe and sensor.

Electronic converters

Different models of electronic control units are available to comply with the options of flow indication, maximum / minimum flow rate control, analog and pulse outputs.

All of them are compatible with the different FLOMAT-FX sensor models.

These converters can be supplied for compact mounting directly on top of the sensor or for remote mounting. Cable is supplied.

HART protocol is available for both MX4 and XT5 converters.

Modbus RTU protocol is available for MX4 converter.
